or pharmaceutically acceptable salts thereof, or prodrugs thereof, which exhibit an excellent inhibitory activity in human SGLT and are useful as agents for the prevention or treatment of a disease associated with hyperglycemia such as diabetes, postprandial hyperglycemia, impaired glucose tolerance, diabetic complications or obesity, pharmaceutical compositions comprising the same, and pharmaceutical uses thereof.

**Description****Technical Field**

5 [0001] The present invention relates to fused heterocyclic derivatives, pharmaceutically acceptable salts thereof or prodrugs thereof which are useful as medicaments, pharmaceutical compositions comprising the same and pharmaceutical uses thereof.

[0002] More particularly, the present invention relates to fused heterocyclic derivatives having an inhibitory activity in human SGLT, pharmaceutically acceptable salts thereof or prodrugs thereof which are useful as agents for the  
10 prevention or treatment of a disease associated with hyperglycemia such as diabetes, impaired glucose tolerance, diabetic complications or obesity, pharmaceutical compositions comprising the same and pharmaceutical uses thereof.

**Background Art**

15 [0003] Diabetes is one of lifestyle-related diseases with the background of change of eating habit and lack of exercise. Hence, diet and exercise therapies are performed in patients with diabetes. Furthermore, when its sufficient control and continuous performance are difficult, drug treatment is simultaneously performed. In addition, it has been confirmed by large-scale clinical trial that it is necessary to practice a long-term strict control of blood sugar level so as to prevent patients with diabetes from occurring and advancing diabetic complications by receiving treatment (for example, see  
20 the following References 1 and 2). Furthermore, many epidemiologic studies on impaired glucose tolerance and macroangiopathy show that impaired glucose tolerance as the boundary type is also a risk factor in macroangiopathy as well as diabetes. Thus, needs to improve postprandial hyperglycemia have been focused (for example, see the following Reference 3).

[0004] In recent years, development of various antidiabetic agents has been progressing with the background of a  
25 rapid increase of patients with diabetes. For example, Antidiabetic agents such as biguanides, sulfonylureas, insulin sensitivity enhancers,  $\alpha$ -glucosidase inhibitors and the like have been employed. However, biguanides and sulfonylureas show occasionally adverse effects such as lactic acidosis and hypoglycemia, respectively. Insulin sensitivity enhancers show occasionally adverse effects such as edema, and are concerned for advancing obesity. In addition,  $\alpha$ -glucosidase inhibitors, which delay carbohydrate digestion and absorption at the small intestine, are used to improve  
30 postprandial hyperglycemia. It has been also reported that acarbose, one of  $\alpha$ -glucosidase inhibitors, has an effect of preventing or delaying the incidence of diabetes by applying to patients with impaired glucose tolerance (for example, see the following Reference 4). However, since  $\alpha$ -glucosidase inhibitors do not affect elevated glucose levels by ingesting a monosaccharide of glucose (for example, see the following Reference 5), with recently changing compositions of sugars in meals, a wider range of activities inhibiting carbohydrate absorption has been desired.

35 [0005] In recent years, research and development of new type antidiabetic agents have been progressing, which promote urinary glucose excretion and lower blood glucose level by preventing reabsorption of excess glucose at the kidney (for example, see the following Reference 6). In addition, it is reported that SGLT2 (sodium-dependent glucose transporter 2) is present in the S1 segment of the kidney's proximal tubule and participates mainly in reabsorption of glucose filtrated through glomerular (for example, see the following Reference 7). Accordingly, inhibiting a human  
40 SGLT2 activity prevents reabsorption of excess glucose at the kidney, subsequently promotes excreting excess glucose through the urine, and normalizes blood glucose level. In addition, since such agents for promoting the excretion of urinary glucose excrete excess glucose through the urine and consequently the glucose accumulation in the body is decreased, they are also expected to have a preventing or alleviating effect on obesity and a diuretic effect. Furthermore, the agents are considered to be useful for various related diseases which occur accompanying the progress of diabetes or obesity due to hyperglycemia.

[0006] Furthermore, it has been known that SGLT1, sodium-dependent glucose transporter 1, exists in the small intestine which controls carbohydrate absorption. It has been also reported that insufficiency of glucose and galactose absorption arises in patients with dysfunction due to congenital abnormalities of human SGLT1 (for example, see the following References 8-10). In addition, it has been confirmed that SGLT1 is involved in glucose and galactose absorption (for example, see the following References 11 and 12). Furthermore, it is confirmed that mRNA and protein of SGLT1 increase and absorption of glucoses are accelerated in OLETF rats and rats with streptozotocin-induced  
50 diabetic symptoms (for example, see the following References 13 and 14). Generally in patients with diabetes, carbohydrate digestion and absorption are increased. For example, it is confirmed that mRNA and protein of SGLT1 are highly increased in the human small intestine (for example, see the following Reference 15). Therefore, blocking a human SGLT1 activity inhibits absorption of carbohydrates such as glucose at the small intestine, subsequently can prevent increase of blood sugar level. Especially, it is considered that delaying glucose absorption based on the above mentioned mechanism is effective to normalize postprandial hyperglycemia.

[0007] Therefore, fast development of antidiabetic agents with novel action mechanism, which have an inhibitory

activity in human SGLT, has been desired to improve or solve the above-mentioned problems.

[0008] Fused heterocyclic derivatives provided in the present invention are entirely novel compounds. It has not ever been reported that these fused heterocyclic derivatives have an inhibitory activities in SGLT1 and/or SGLT2 and inhibit absorption of glucose and galactose at the small intestine, or are useful as agents to inhibit reabsorption of excess glucose at the kidney.

### Test Example 1

#### Assay for inhibitory effects on human SGLT1 activity

##### 1) Cloning and construction of the vector expressing human SGLT1

[0280] The cDNA library was prepared for PCR amplification by reverse transcription from total RNA deprived from human small intestine (Ori gene) using oligo-dT as a primer. Using this cDNA library as a template, the DNA fragment coding 1 to 2005 bp of human SGLT1 (ACCESSION: M24847), which was reported by Hediger et al. , was amplified by PCR method and inserted into the multi-cloning site of pcDNA3.1(-) (Invitrogen). The DNA sequence inserted was perfectly matched to the previously reported sequence.

##### 2) Establishment of cell line stably expressing human SGLT1

[0281] The expression vector of human SGLT1 was digested by Sca I into a linear DNA. The linear DNA was transfected into CHO-K1 cells by means of lipofection (Effectene Transfection Reagent: QIAGEN). Neomycin resistant cell lines were selected by culture in the medium containing G418 (1 mg/mL, LIFE TECHNOLOGIES), and then the activity against the uptake of methyl- $\alpha$ -D-glucopyranoside was measured by the method described below. The cell line, which showed the greatest uptake activity, was selected and designated as CS1-5-11D. CS1-5-11D cells were cultured in the presence of G418 at 200  $\mu$ g/mL.

##### 3) Measurement of the inhibitory activity against the uptake of methyl- $\alpha$ -D-glucopyranoside ( $\alpha$ -MG)

[0282] CS1-5-11D cells were seeded into a 96-well culture plate at a density of  $3 \times 10^4$  cells/well and cultured for 2 days, and were used in the uptake assay. A mixture of non-labeled (Sigma) and  $^{14}$ C-labeled  $\alpha$ -MG (Amersham Pharmacia Biotech) was added to the uptake buffer (pH 7.4; containing 140 mM sodium chloride, 2 mM potassium chloride, 1 mM calcium chloride, 1 mM magnesium chloride, 10 mM 2-[4-(2-hydroxyethyl)-1-piperazinyl]ethane sulfonic acid and 5 mM tris(hydroxymethyl)aminomethane) at the final concentration of 1 mM. A test compound was dissolved in dimethyl sulfoxide, and then appropriately diluted with distilled water. The test compound solution was added to the uptake buffer containing 1 mM  $\alpha$ -MG, and designated as a measurement buffer. For the control group, the measurement buffer without any test compound was prepared. For measuring the basal uptake, a basal uptake measurement buffer which contains 140 mM choline chloride instead of sodium chloride was prepared. After removing the culture medium of CS1-5-11D cells, 180  $\mu$ L of the pre-treatment buffer (the basal uptake buffer without  $\alpha$ -MG) was added to each well and incubated at 37° C for 10 minutes. After repeating the same treatment, the pre-treatment buffer was removed. To each well was added 75  $\mu$ L of the measurement buffer or the basal uptake buffer was added and incubated at 37° C for 1 hour. After removing the measurement buffer, cells were washed twice with 180  $\mu$ L per well of the washing buffer (the basal uptake buffer containing 10 mM non-labeled  $\alpha$ -MG). The cells were solubilized by 75  $\mu$ L per well of 0.2 mol/L sodium hydroxide. The cell lysates were transferred into PicoPlates (Packard), and then added 150  $\mu$ L of MicroScint-40 (Packard) and mixed. Radioactivity was measured by means of micro-scintillation counter TopCount (Packard). One hundred % was set to the difference between the uptake in the control group and the basal uptake, and the uptake of methyl  $\alpha$ -D-glucopyranoside at each drug concentration were calculated. The drug concentration, at which 50% uptake of methyl  $\alpha$ -D-glucopyranoside was inhibited (IC<sub>50</sub> value), was calculated using logit plot. The results are shown in Table 6.

## INTERNATIONAL SEARCH REPORT

International application No.

PCT/JP2004/004009

**Box No. II** Observations where certain claims were found unsearchable (Continuation of item 2 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.: 15-18, 25  
because they relate to subject matter not required to be searched by this Authority, namely:  
Claims 15 to 18 and 25 involve treatment of the human body by therapy and thus relate to a subject matter which this International Searching Authority is not required to search.
2. ☐ Claims Nos.:  
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

**Box No. III** Observations where unity of invention is lacking (Continuation of item 3 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

**Remark on Protest**

- ☐ The additional search fees were accompanied by the applicant's protest.  
☐ No protest accompanied the payment of additional search fees.
